

## AGENDA

13:30 – 14:00 VALIMAT® - What's new

14:00 – 14:30 User defined material cards

14:30 – 14:45 Templates and reports

14:45 – 15:00 Coffee break

15:00 – 15:15 User defined specimen

15:15 – 16:00 Python interface

16:00 – 16:30 Q&A

# VALIMAT® – New Features

- VALIMAT® 3.7
- VALIMAT® 3.8

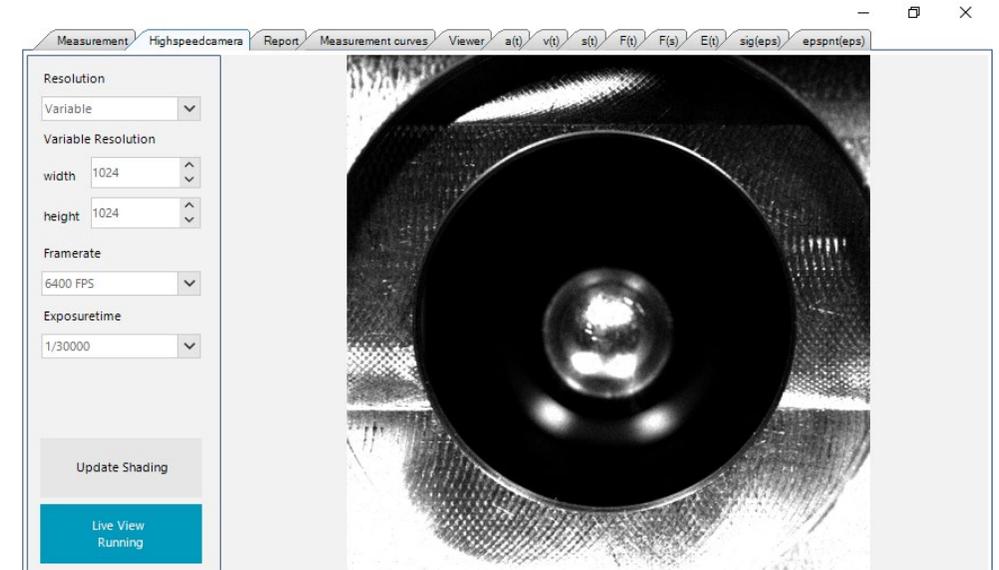

**VALIMAT**  
Updates in 3.7

# VALIMAT® 3.7

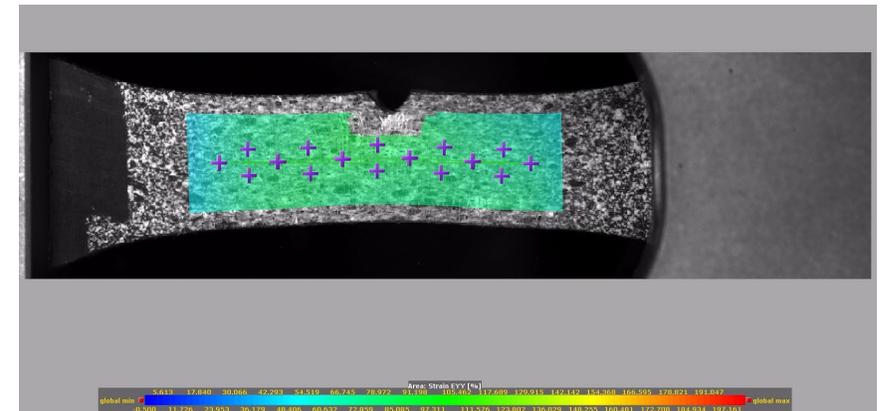

- Photron Highspeed camera implementation

- Enabled in the settings  
Machine parameter → Highspeed camera  
Automatic highspeed video creation  
IP-Address of the highspeed camera
- Images will be automatically transferred to the correct curve store folder

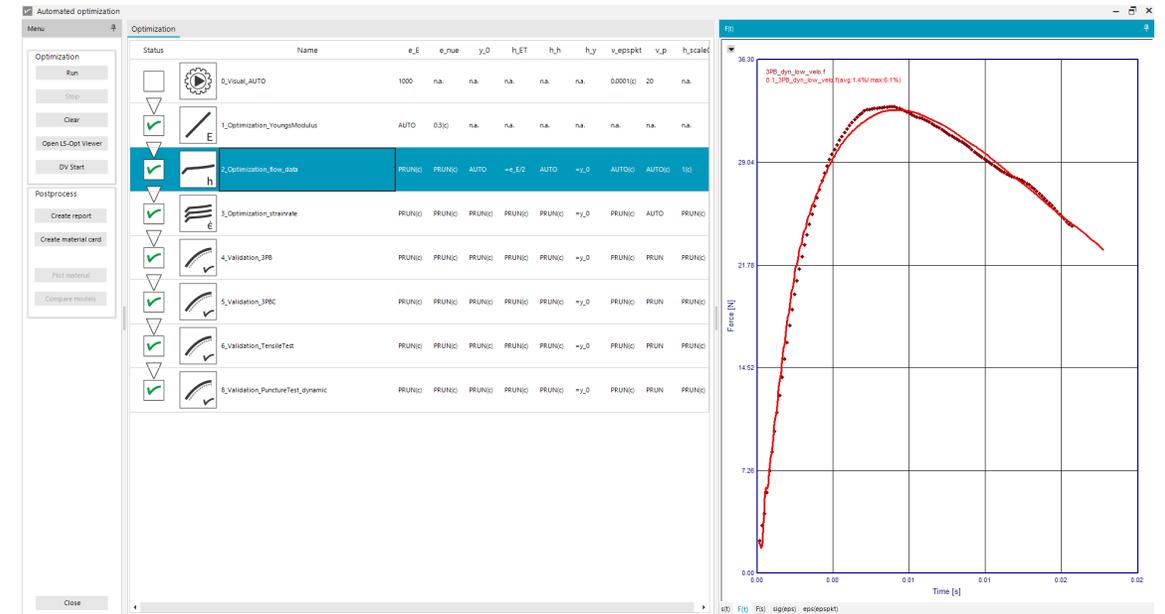

- MercuryRT DIC evaluation implementation

- When the Software MercuryRT is available it can be used for automatic DIC evaluation  
(Please contact 4a for more information)

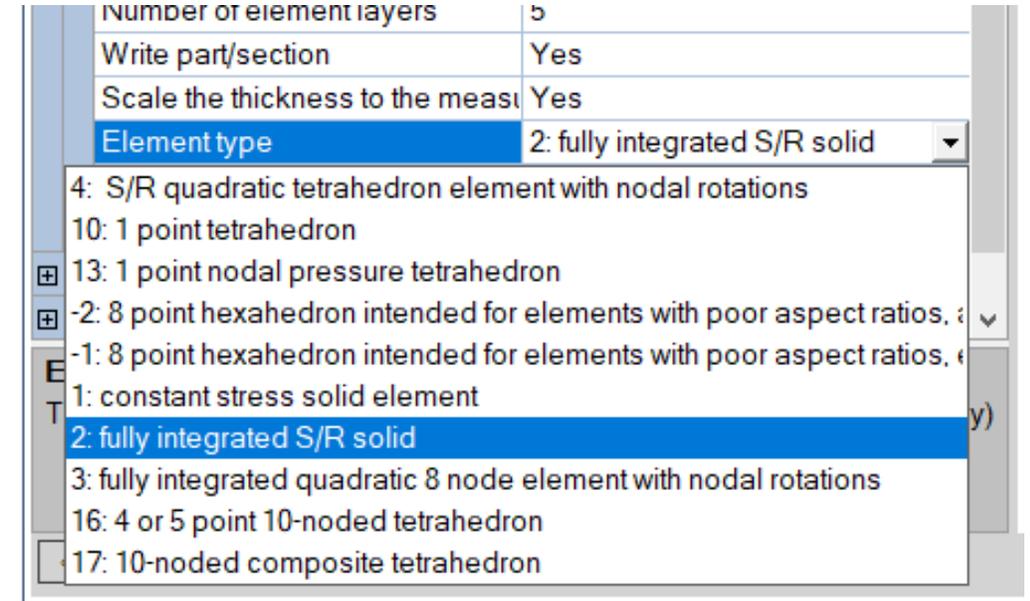

# VALIMAT® 3.7

- New Autofit (visibility triggered by license-feature)
- Automatic report creation by setting the PPT-Template into the comment of the model
  - Usage: PPT-Template:xxx or PPT-Template:None
  - Name of the template-file that must be present in the report folder set in the Valimat settings
- Reference other models by index in all text replacements
  - Usage: <<A\_NAME;index:3>>

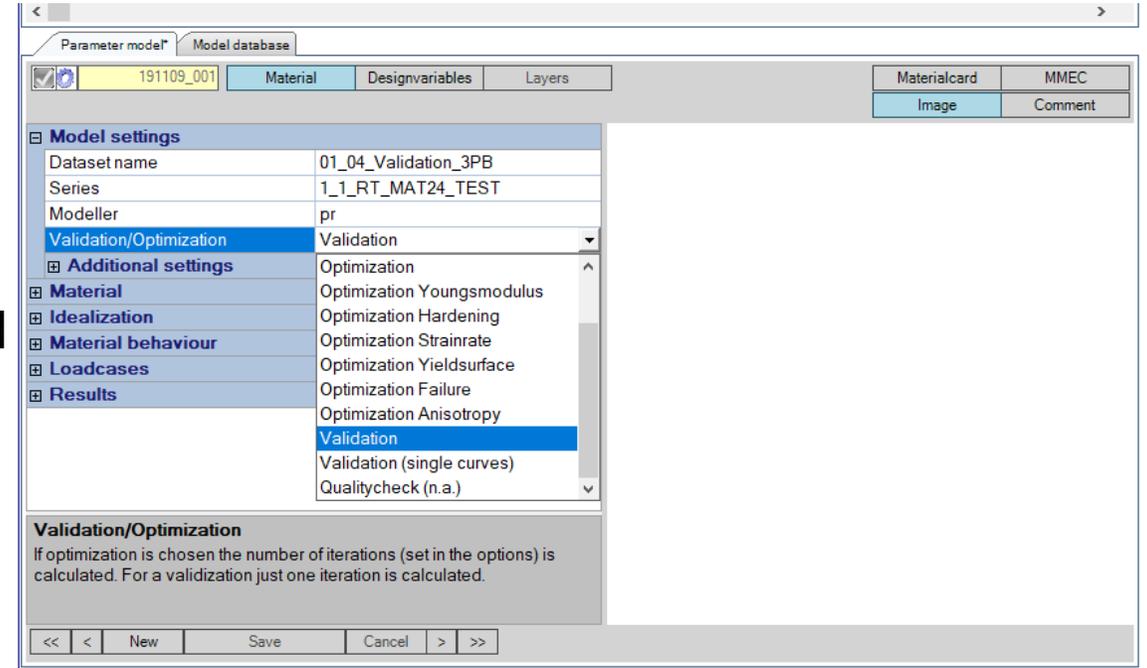

# VALIMAT® 3.7

- 1-Element simulations for Abaqus 2019
- Tensile test simulations for Abaqus returns a force again
- Updated PAM-Crash to new standards at Audi
- New Element forms for LS-Dyna solids (Type -1, -2 and 3)
- On the old import allow to save more than one setting
- Added new options to “curve up to” in the cases
  - Maximum t-end in the tests
- All time based “curve up to” can now have a scaling-factor >1.0
- When importing external QS data into Valimat and the dataset has a manual filter set, then reset it to 0 (no filter)

# VALIMAT® 3.7

- Open / Collapse group rows by pressing shift and clicking with the left mouse-button on a group row
- Added new options to the Validation/Optimization dropdown
  - Also the recommended settings for the selected options are set
- New default values for number of points (100) and biasing (unbiased)
- Added \*MAT\_123, \*MAT\_187 logarithmic R9.3+
- New folder browser dialogue

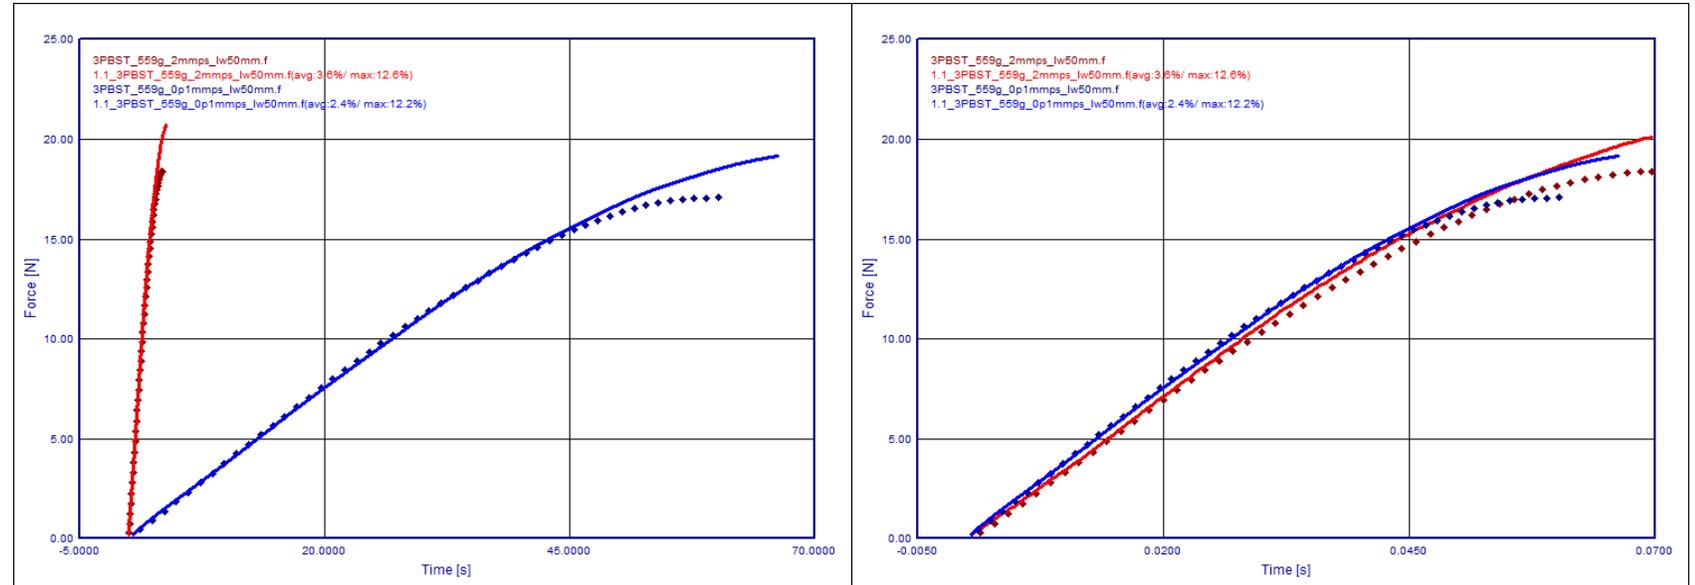

**VALIMAT**

Preview 3.8

- New Autofit with failure optimization
- 3PB-XX specimen test option available
- Quick-filter in database view

# VALIMAT® - Added non-scaled graphing on time-scaled simulations

Feature to properly plot time-scaled and non time-scaled curves in one graph

[-] Postprocessing	
Deviation	1
Number of animation plots	10
Trim resultcurves?	False
Plot resultcurves timescaled?	True
[-] Averaging	
True	
[-] 4a Solver Settings	
False	
[-] Links/references	

## VALIMAT<sup>®</sup> 3.8 – Changes

- “Optimization Anisotropy” behaves similar to “Optimization Elastic”
- Deliver a Python package with Valimat<sup>®</sup>. No installation of Python is needed anymore. (Python 3.8.1)
- \**MAT\_187* uses LCID-P for all cases. Change the custom variables (xm\_nuep\_plat and xm\_nuep\_pres) to be dependent on y\_nuep. This makes it behave like a constant nuep over the strain.
- All the MAT\_ADD\_EROSION implementations use logarithmic strain-rate interpolation now.
- Add a different implementation of the Cowper-Symonds strain-rate definition

## VALIMAT® 3.8 - Bugfixes

- Reference to wrong curve for the yield-shear curve
- *\*MAT\_024* + Bilinear option had missing variables
- Correct the clamping length in Tensile test-simulations (in some cases it could happen that the specimen was clamped asymmetric)
- *\*MAT\_187* in the “vonMises (non associated)” option *y\_nuep* was missing
- *\*MAT\_262* (added missing variables, ETAN, PFL and SOFT)
- Initial penetration of shell puncture test (in Abaqus and Pam-Crash)
